## Fitness Finder

By Jacqueline Kolze, & Savannah

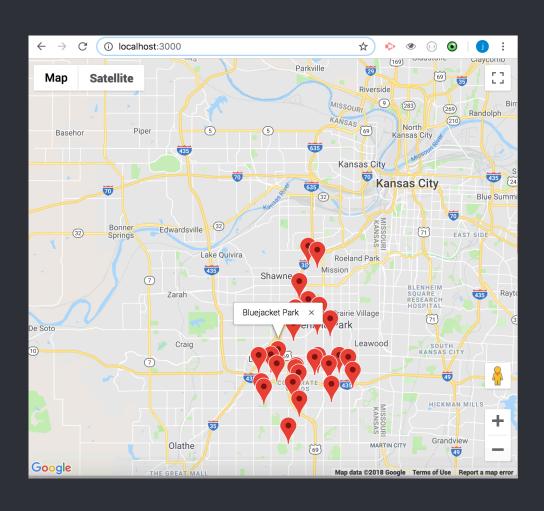

#### Motivation

Fitness Finder is a app that combines all Fitness related items in one place.

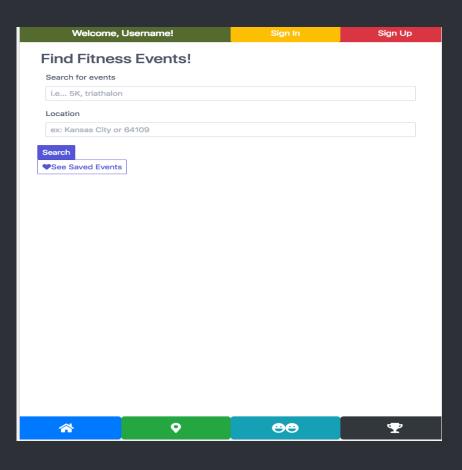

# How Does Fitness Finder Work?

Fitness Finder starts off by directing the user to the home page. On the log in page, it asks for username and password. If you aren't logged in you can sign up. From there you can look for new parks to explore using the Foursquare and Google Maps API. Look for athletic events using the eventful API. Or track fitness stuff.

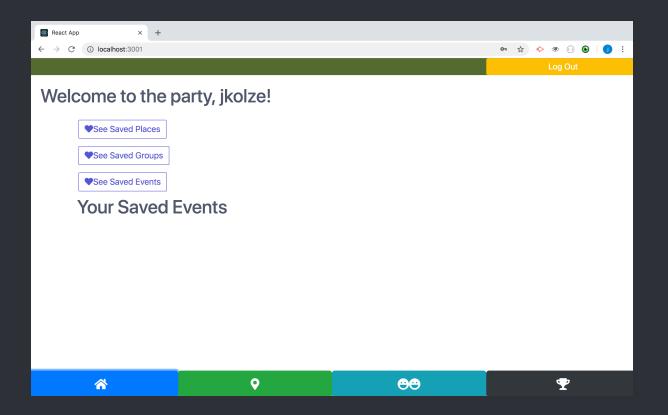

#### Map/Park finder page

#### Eventful API/Events page

### Home page

#### Roles

 Jacqueline did all the backend stuff, this involves all the user related stuff (sign up, login, logout, etc). Setting up the API's. Specifically the Google Maps Api with Foursquare api. Savannah did front end stuff. Such as designing all the pages, picking colors, fonts and more. She is also helping out with the meetup page. We are planning on using eventful api to help with this.

#### Challenges and Issues

- -API's were/still are a struggle to set up within React.
- -The original athletic event api we were going to use was outdated.

#### Remaining efforts

- -Integrating the Eventful API, Jacqueline
- -Adding A activity tracker.
- -Working on the favorites page, Savannah

#### **Future Revisions**

-We would love to make a favorites section! To make the user experience better.
